

OBJECTIVE FOR DEVELOPMENTAL TYPE

Z-2835*

TRIODE

The Z-2835 is a high-mu triode of ceramic-and-metal planar construction. The tube is intended for radio-frequency oscillator and power-amplifier applications.

GENERAL

Electrical

Cathode - Coated Unipotential

Heater Characteristics and Ratings

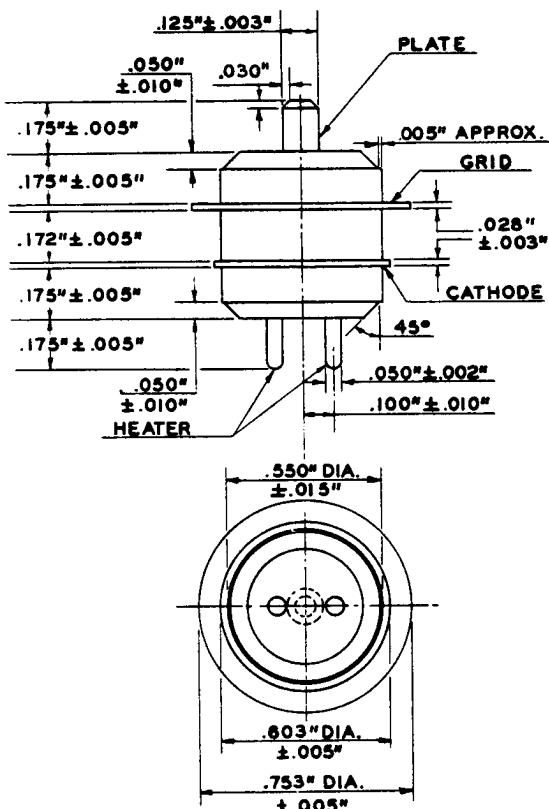

Heater Voltage, AC or DC+	6.3 ± 0.3	Volts
Heater Current†	0.4	Amperes

Direct Interelectrode Capacitances§

→ Grid to Plate: (g to p)	1.4	pf
→ Grid to Cathode and Heater: g to (h + k)	5.1	pf
Plate to Cathode and Heater: p to (h + k)	0.03	pf
Heater to Cathode: (h to k)	2.4	pf

Mechanical

Operating Position - Any

MAXIMUM RATINGS**Absolute-Maximum Values**

Plate Voltage	330	Volts
Positive DC Grid Voltage	0	Volts
Negative DC Grid Voltage	50	Volts
Plate Dissipation	5.5	Watts
DC Grid Current	10	Milliamperes
DC Cathode Current	30	Milliamperes
Peak Cathode Current	120	Milliamperes
Cathode-Cathode Voltage		
Heater Positive with Respect to Cathode	50	Volts
Heater Negative with Respect to Cathode	50	Volts
Grid Circuit Resistance		
With Fixed Bias	0.1	Megohms
With Cathode Bias	0.18	Megohms
Bulb Temperature at Hottest Point	250	C

Absolute-Maximum ratings are limiting values of operating and environmental conditions applicable to any electron tube of a specified type as defined by its published data and should not be exceeded under the worst probable conditions.

The tube manufacturer chooses these values to provide acceptable serviceability of the tube, making no allowance for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the tube under consideration and of all other electron devices in the equipment.

The equipment manufacturer should design so that initially and throughout life no absolute-maximum value for the intended service is exceeded with any tube under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of the tube under consideration and of all other electron devices in the equipment.

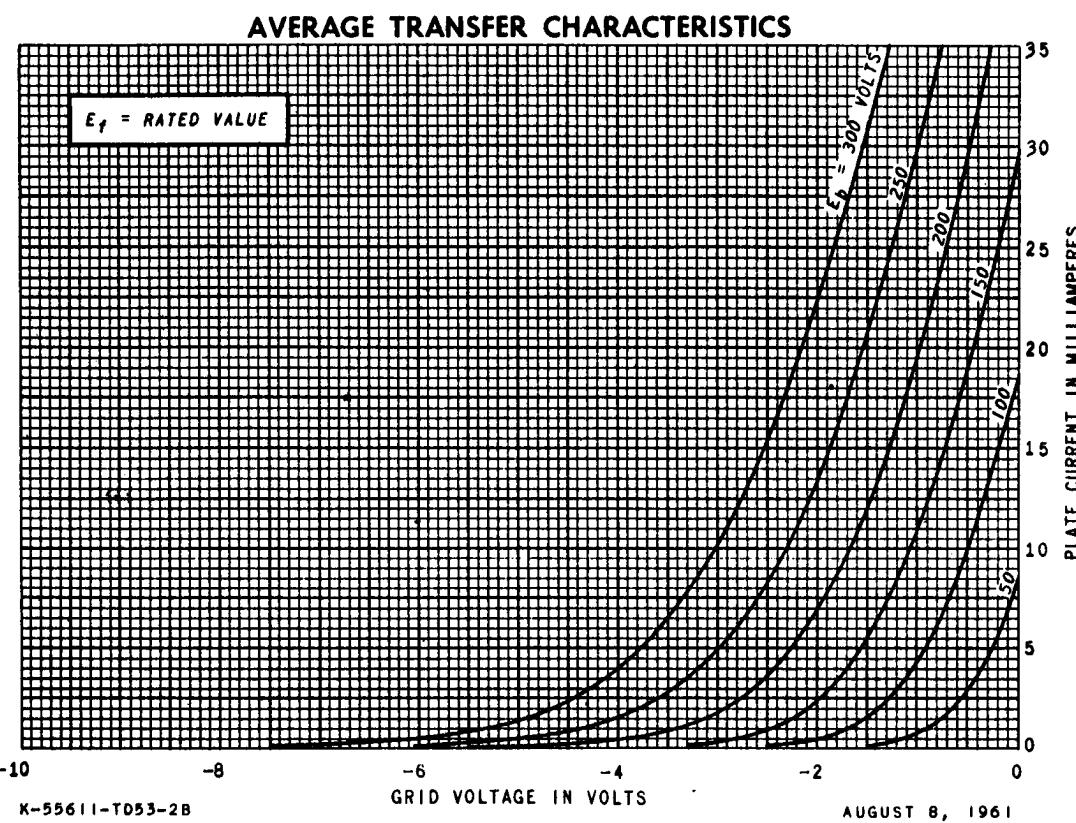

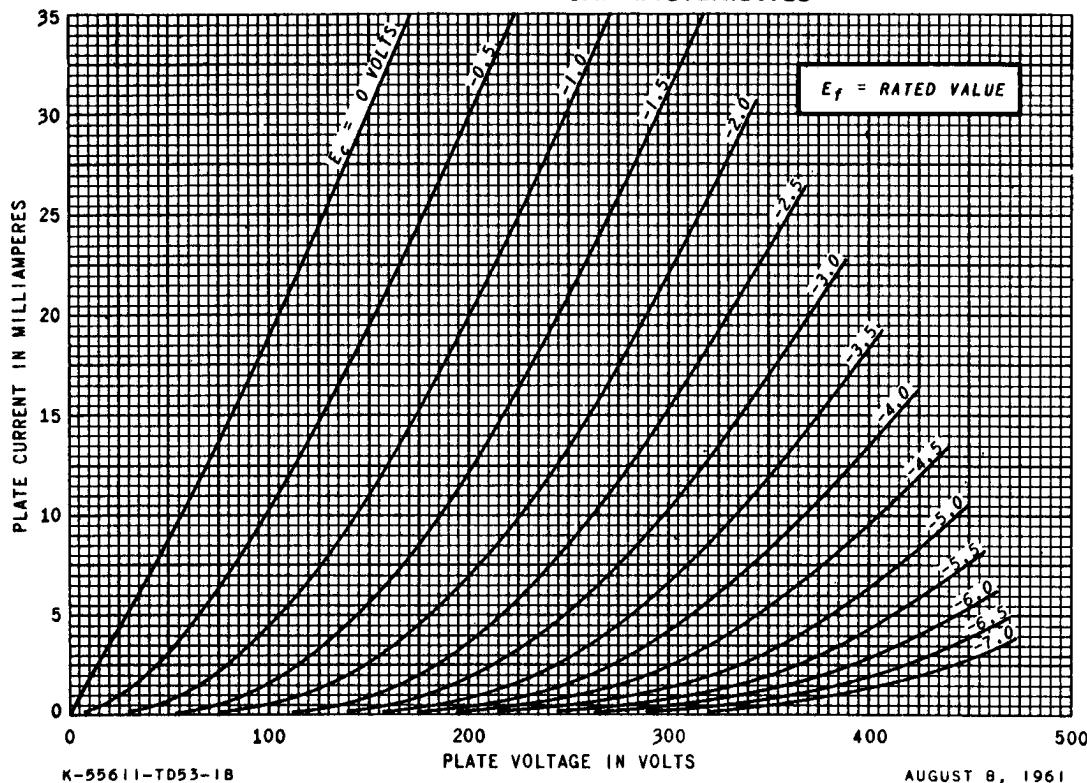

CHARACTERISTICS AND TYPICAL OPERATION**Average Characteristics**

Plate Voltage	200	Volts
Cathode-Bias Resistor	68	Ohms
Amplification Factor	90	
Plate Resistance, approximate	5450	Ohms
Transconductance	16500	Micromhos
Plate Current	17	Milliamperes
Grid Voltage, approximate		
$I_b = 10$ Microamperes	-5.5	Volts

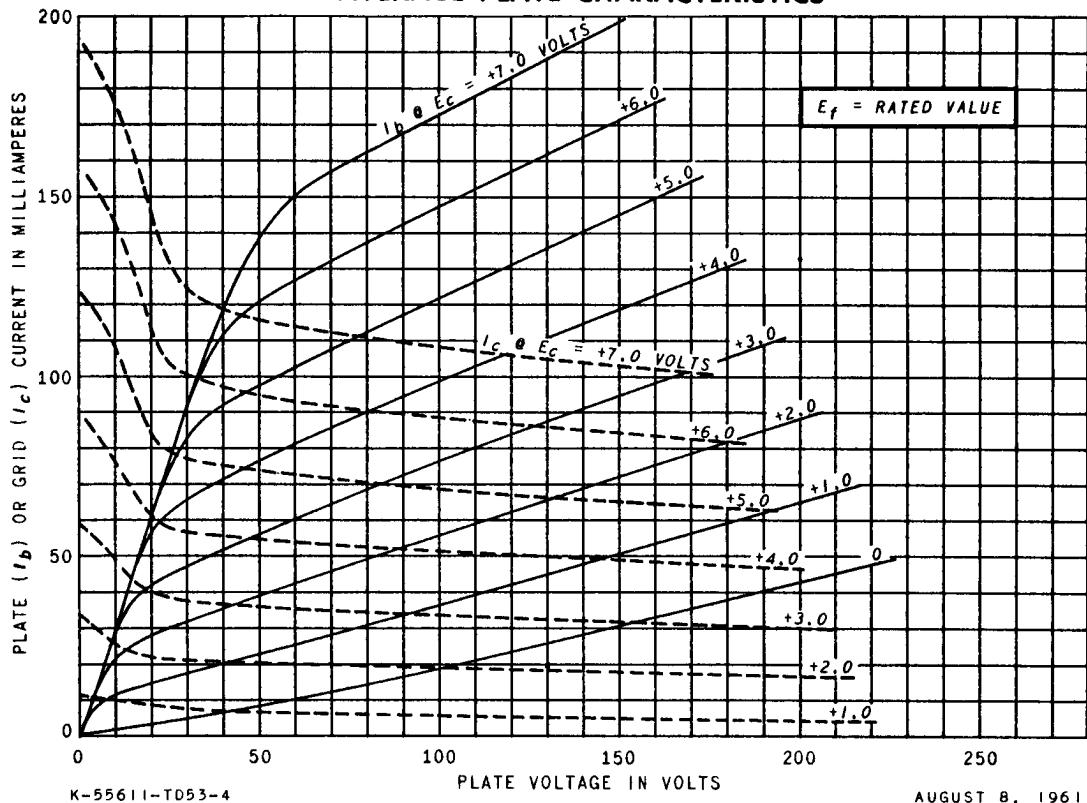

- * Publication of these data does not obligate the General Electric Company to manufacture a tube with these characteristics.
- + The equipment designer should design the equipment so that the heater voltage is centered at the specified bogey value, with heater supply variations restricted to maintain heater voltage within the specified tolerance.
- # Heater current of a bogey tube at Ef = 6.3 volts.
- § Without external shield.
