

## RADAR DISPLAY TUBE TYPE 14AZP4

The 14AZP4 is a magnetically focused, magnetically deflected cathode ray display tube. Its high resolution gun coupled with high brightness capabilities make it especially suited for high resolution monitor applications. The face is gray-glass for improved contrast and the screen is aluminized for increased brightness.

- \* Brilliance and definition decrease with decreasing anode voltage. In general, anode voltage should not be less than 12 000 volts.
- ▲ Protective resistance in the Grid 2 and Grid 4 circuits is advisable to prevent damage to the tube.
- For RMA standard focus coil, JEDEC #109, or equivalent to produce best focus at an anode current of 100  $\mu\text{a}$ .
- ▲ With an anode current of 100 microamperes, typical line width at center of faceplate, using half-amplitude points of light energy distribution of a single line, is 0.013".

X-Ray Warning: Inasmuch as the tube rating permits operation at voltages as high as 22 kilovolts (absolute value), shielding of the tube for x-ray radiation may be needed whenever the operating conditions involve voltage in excess of 16 kilovolts.

NOTE 1: Anode terminal alignment with vacant base-pin position 3 has angular tolerance about tube axis of  $\pm 30^\circ$ .

NOTE 2: Yoke Reference Line is determined by plane of flared end of JEDEC Reference-Line Gauge No. 110 when seated on funnel of tube.

NOTE 3: The socket should not be mounted rigidly but should be allowed to move freely and have flexible leads.

X-RAY WARNING: Operation with voltages in excess of 16KV may require shielding to limit radiation of very soft x-rays.
